

Instructions:

This assignment consists of 2 parts.

The first part requires you to fix the sample code Part1-FixingTask and then use the logic in the second part ( it is optional ).

The second part requires you to develop a simple Address book page.

The page should consist of a way of selecting between the type of User --> Student /Teacher (you should be using all the OOP concepts). For this part, you can use Dropdown Menu or Radio Button.

Once the user is selected a list/ table with names, addresses, and images should be rendered.

Upon clicking over the image, detailed information should pop out in a modal.

The last feature of your web page is similar to the fixing task search functionality. At this part you can reuse the fixed logic from the fixing task or have your own logic.
